

Problem 2: Factorial!

Difficulty: Easy

Author: Vedant Patel, Stratford, Connecticut, United States

Problem Background

Factorials make numbers appear exciting! Represented by an exclamation point after an integer, a factorial of a number is equal to the product of that number and all positive integers less than it. For example, $3!$ is equal to $1 * 2 * 3 = 6$.

Problem Description

Write a program that can calculate the factorial of a given integer. Be careful; factorials get *very* large, *very* fast.

Sample Input

The first line of your program's input, received from the standard input channel, will contain a positive integer representing the number of test cases. Each test case will include a single line containing a positive integer.

```
2
3
4
```

Sample Output

For each test case, your program must print the factorial of the given number.

```
6
24
```
